

High Performance Liquid Chromatography

Vial Selection Guide

Vial selection for an HPLC system is an important but often overlooked step. Several characteristics of vials and septa are critical for optimum performance in an HPLC run. The following guide will assist you in making the best selection for your specific analysis.

Vial Mouth Opening

A 6mm opening for the 1.5mL vial provides a better target for the autosampler needle and makes filling easier and cleaner, especially with automatic pipettors. LabTotal vials have a 9mm opening for maximum sample retrieval via pipette.

Glass Thickness

Uniformity of the vial bottom thickness ensures consistent needle depth from run to run and is one of 14 strictly controlled manufacturing points.

Septa Quality

The 1.5 and 4mL vials use a PTFE/silicone septum and its cleanliness is suitable for everyday applications as well as the most discriminating LCMS analyses. The septum is press-fit inside the cap without any bonding agents, which could potentially contaminate samples. It also prevents the needle from pushing the septum into the vial. A pre-slit version is also available.

One-Twist Cap

For high-throughput labs, our single-twist cap allows fast and easy sample preparation. We also offer a 1.5mL snap-cap vial for extra convenience.

Low Adsorption Glass

Shimadzu Low and Extra Low Adsorption glass vials are made from pharmaceutical Type I borosilicate glass by a unique process that yields a surface chemistry with significantly reduced sample interactions without the use of a coating. This results in extremely low compound loss through adsorption or catalytic degradation. Our glass vials have very low reactivity, pH shift, and leaching characteristics.

Extra Low Adsorption vials are a must have for MS users or when working with micromolar concentrations and/or low sample volumes, where the surface-to-volume effects are much more pronounced.

The 12x32mm 1.5mL clear and amber vials are also available with silanized glass, which is a conventional way to lower adsorption of polar compounds by chemically modifying the glass with permanently bonded hydrophobic groups via multi-step gas phase deactivation to make the surfaces inert.

HPLC Vials

Consult your user manual for recommended needle stroke settings prior to starting your analysis.

Filter Vials

Our filter vials offer a single sample filtration system, all performed in an autosampler-ready vial. The filter vial consists of two parts: a filter vial shell and a plunger which includes a filter on one end and a vial cap on the other end. Samples are filtered by pipetting the sample into the filter vial shell, inserting the plunger into the shell, and then pushing the plunger into the shell.

For Shimadzu autosamplers, needle stroke needs to be set to no more than 49mm for the 1.5mL vial rack. For non-Shimadzu autosamplers, needle stroke needs to be set to 5mm from the bottom of the filter vial. Consult your user manual for instructions on how to change needle stroke settings.

Filter vials are available in a variety of filter membranes and pore sizes and come with pre-slit septa. Vials are 12 x 32mm and come 100/pack.

Membrane Material	Aqueous Samples	Organic Samples	Low Protein Binding Samples
PTFE (polytetrafluoroethylene)		x	
Nylon	x	x	
PVDF (polyvinylidene difluoride)	x	x	x
PES (polyethersulfone)	x	x	x

Membrane Material Explanations	
PTFE (polytetrafluoroethylene)	hydrophobic membrane for use for samples containing >50% organic solvents
Nylon	membrane for hydrophilic samples
PVDF (polyvinylidene difluoride)	low protein binding membrane for use with samples containing <50% organic solvents including proteins, peptides and E.coli
PES (polyethersulfone)	low protein binding membrane for aqueous samples, mostly used for mammalian cell culture (antibodies and proteins)

Pore Size	Cells / Cell Debris in Sample	LC Column Particle Size < 3µm	LC Column Particle Size > 3µm
0.2µm	x	x	
0.45µm			x
